1 Simple Harmonic Motion

1.1

- (a) (i) $T = 4 \text{ s}$
(ii) $\omega = \frac{\pi}{2} \text{ rad/s}$
(iii) $\omega^2 = \frac{k}{m} \Rightarrow k = m\omega^2 = \frac{\pi^2}{8} \text{ N/m}$

1.2

- (a)

$$\begin{aligned}
x &= A \cos \omega t \\
&= A \cos 2\pi f t \\
v &= -2\pi f A \sin 2\pi f t \\
v_{\max} &= 2\pi f A \\
&= 1.38 \text{ m/s}
\end{aligned}$$

- (b)

$$\begin{aligned}
a &= -4\pi^2 f^2 A \cos 2\pi f t \\
a_{\max} &= 4\pi^2 f^2 A \\
&= 3.82 \times 10^3 \text{ m/s}^2
\end{aligned}$$

1.3

$$\begin{aligned}a_{\max} &\leq g \\4\pi^2 f^2 A &\leq g \\f &\leq \sqrt{\frac{g}{4\pi^2 A}} \\&\leq 1.11 \text{ Hz}\end{aligned}$$

1.4

(a)

$$\frac{U}{E} = \frac{\frac{1}{2}k\left(\frac{1}{2}A\right)^2}{\frac{1}{2}kA^2} = \frac{1}{4} \Rightarrow \frac{K}{E} = \frac{3}{4}$$

- (b)
- (i) The total energy will increase by a factor of 4
 - (ii) The maximum velocity will increase by a factor of 2
 - (iii) The maximum acceleration will increase by a factor of 2 and the period won't change

1.5

(a) $E = \frac{1}{2}mv^2 + \frac{1}{2}kx^2 = 0.41 \text{ J}$

(b)

$$\begin{aligned}E &= \frac{1}{2}kA^2 \\A &= \sqrt{\frac{2E}{k}} \\&= 4.5 \text{ cm} \\\omega &= \sqrt{\frac{k}{m}} \\&= \sqrt{\frac{1600}{3}} \\&= \frac{40}{\sqrt{3}} \\&= 23 \text{ rad/s} \\x &= A \cos(\omega t + \phi) \\\phi &= \arccos\left(\frac{x}{A}\right) - \omega t \\&= 2.7 \text{ rad} \\x &= 0.045 \cos(23t + 2.7) \text{ m}\end{aligned}$$

1.6

Using the angular frequency of system (b) ω_b as the baseline, the angular frequency of system (a) ω_a is

$$\begin{aligned} F &= ma = -2kx \\ a &= -\frac{2k}{m}x \\ \omega_a &= \sqrt{\frac{2k}{m}} \\ &= \sqrt{2}\omega_b \end{aligned}$$

and the angular frequency of system (c) ω_c is

$$\begin{aligned} F &= ma = -\frac{k}{2}x \\ a &= -\frac{k}{2m}x \\ \omega_c &= \sqrt{\frac{k}{2m}} \\ &= \sqrt{\frac{1}{2}}\omega_b \end{aligned}$$

1.7

- (a) The test tube experiences a bouyancy force of $F = Ag\rho x$ so its equation of motion is

$$\begin{aligned} F &= ma = -Ag\rho x \\ a &= -\frac{Ag\rho}{m}x \\ \omega &= \sqrt{\frac{Ag\rho}{m}} \end{aligned}$$

- (b) The work done by the bouyancy force when moving from equilibrium to x and thus the potential energy is

$$\begin{aligned} U &= \int_0^x Ag\rho x' dx' \\ &= \frac{1}{2}Ag\rho x^2 \end{aligned}$$

so the total energy of the system is

$$E = \frac{1}{2}mv^2 + \frac{1}{2}Ag\rho x^2$$

1.8

$$s \propto \text{kg}^\alpha \text{m}^\beta \left(\text{m/s}^2\right)^\gamma$$

so $\alpha = 0$, $\beta = 1/2$, and $\gamma = -1/2$ meaning

$$T \propto \sqrt{\frac{l}{g}}$$

1.9

(a)

$$x = A \cos \sqrt{\frac{g}{l}}t$$

$$v = -\sqrt{\frac{g}{l}}A \sin \sqrt{\frac{g}{l}}t$$

$$\begin{aligned} v_{\max} &= \sqrt{\frac{g}{l}}A \\ &= 0.018 \text{ m/s} \end{aligned}$$

(b) The pendulum reaches its maximum speed at the bottom of its swing which occurs after a quarter cycle

$$\frac{1}{4}T = \frac{1}{4} \frac{2\pi}{\omega} = \frac{\pi}{2\sqrt{g/l}} = 0.43 \text{ s}$$

1.10

$$I \frac{d^2\theta}{dt^2} = \tau$$

$$\frac{1}{3}ML^2 \frac{d^2\theta}{dt^2} = -kL \sin \theta L \cos \theta$$

$$\frac{1}{3}M \frac{d^2\theta}{dt^2} = -k\theta$$

$$\frac{d^2\theta}{dt^2} = -\frac{3k}{M}\theta$$

$$T = \frac{2\pi}{\omega}$$

$$= 2\pi \sqrt{\frac{M}{3k}}$$

1.11

(a)

$$\begin{aligned}
 F &= -\frac{dU}{dx} = -\left(\frac{6a}{x^7} - \frac{12b}{x^{13}}\right) \\
 0 &= \frac{12b}{x^{13}} - \frac{6a}{x^7} \\
 &= \frac{12b}{x^6} - 6a \\
 6a &= \frac{12b}{x^6} \\
 x^6 &= \frac{2b}{a} \\
 x &= \left(\frac{2b}{a}\right)^{1/6}
 \end{aligned}$$

1.12

(a)

$$\begin{aligned}
 K &= \frac{1}{2}Mv^2 + \int dK \\
 &= \frac{1}{2}Mv^2 + \int_0^L \frac{1}{2} \frac{m}{L} \left(\frac{l}{L}v\right)^2 dl \\
 &= \frac{1}{2}Mv^2 + \frac{1}{2} \frac{mv^2}{L^3} \int_0^L l^2 dl \\
 &= \frac{1}{2}Mv^2 + \frac{1}{2} \frac{mv^2}{L^3} \frac{1}{3}L^3 \\
 &= \frac{1}{2}Mv^2 + \frac{1}{6}mv^2 \\
 &= \frac{1}{2}(M + m/3)v^2 \\
 E &= K + U \\
 &= \frac{1}{2}(M + m/3)v^2 + \frac{1}{2}kx^2
 \end{aligned}$$

(b)

$$\omega = \sqrt{\frac{k}{M + m/3}}$$

1.13

(a)

$$\begin{aligned} K &= E - U \\ \frac{1}{2}mv^2 &= U(A) - U(x) \\ v &= \sqrt{2[U(A) - U(x)]/m} \end{aligned}$$

(b)

$$\begin{aligned} T &= 4 \int_0^A \frac{dx}{v} \\ &= 4 \int_0^A \sqrt{\frac{m}{2[U(A) - U(x)]}} dx \\ &= 4 \sqrt{\frac{m}{2U(A)}} \int_0^A \frac{dx}{\sqrt{1 - U(x)/U(A)}} \end{aligned}$$

(c)

$$\begin{aligned} T &= 4 \sqrt{\frac{m}{2\alpha A^n}} \int_0^A \frac{dx}{\sqrt{1 - (x/A)^n}} \\ &= 4 \sqrt{\frac{m}{2\alpha A^n}} \int_0^1 \frac{A d\xi}{\sqrt{1 - \xi^n}} \\ &= cA^{(n/2)-1} \end{aligned}$$

2 The Damped Harmonic Oscillator

2.1

$$\begin{aligned} \left(\frac{\gamma}{2}\right)^2 &= \omega_0^2 \\ \frac{b}{2m} &= \sqrt{\frac{k}{m}} \\ b &= 2m\sqrt{\frac{k}{m}} \\ &= 2m\sqrt{\frac{mg/x}{m}} \\ &= 2m\sqrt{\frac{g}{x}} \\ &= 64 \text{ kg/s} \end{aligned}$$

2.2

$$\begin{aligned}
 \frac{A_{n+1}}{A_n} &= 0.90 \\
 e^{-2.5\gamma/2} &= 0.90 \\
 e^{2.5\gamma/2} &= \frac{1}{0.90} \\
 \frac{2.5\gamma}{2} &= \ln \frac{1}{0.90} \\
 \gamma &= \frac{2}{2.5} \ln \frac{1}{0.90} \\
 &= 8.43 \times 10^{-2} \text{ s}^{-1} \\
 F &= -bv \\
 &= -(4.21 \times 10^{-2})v
 \end{aligned}$$

2.3

After 10 cycles the amplitude has decreased by a factor of 5/3. The energy of the system is proportional to the amplitude squared, so

$$\begin{aligned}
 E(300) &= E(0)e^{-300/\tau} \\
 e^{300/\tau} &= \frac{E(0)}{E(300)} \\
 \tau &= \frac{300}{\ln[E(0)/E(300)]} \\
 &= \frac{300}{\ln \frac{25}{9}} \\
 &= 294 \text{ s} \\
 Q &= \omega_0 \tau \\
 &= \frac{2\pi\tau}{T} \\
 &= 61.5
 \end{aligned}$$

2.4

$$\begin{aligned}
 \frac{E(10T)}{E_0} &= \frac{E_0 e^{-\gamma 10T}}{E_0} \\
 \frac{1}{2} &= e^{-\gamma 10T} \\
 \frac{E(50T)}{E_0} &= \frac{E_0 e^{-\gamma 50T}}{E_0} \\
 &= (e^{-\gamma 10T})^5 \\
 &= \left(\frac{1}{2}\right)^5 \\
 &= \frac{1}{32}
 \end{aligned}$$

2.5

(a)

$$\begin{aligned}
 Q_{0.01} &= 310 \\
 \omega_{0.01} &= 3.14 \text{ rad/s} \\
 Q_{0.30} &= 10.5 \\
 \omega_{0.30} &= 3.14 \text{ rad/s} \\
 Q_{1.00} &= 3.14 \\
 \omega_{1.00} &= 3.10 \text{ rad/s}
 \end{aligned}$$

(c)

$$\begin{aligned}
 \gamma^2/4 &= \pi^2 \\
 \gamma &= 2\pi \\
 x &= Ae^{-\pi t} + Bte^{-\pi t} \\
 A &= 10 \text{ mm} \\
 v &= -10\pi e^{-\pi t} + Be^{-\pi t} - \pi Bte^{-\pi t} \\
 0 &= -10\pi + B \\
 B &= 10\pi \\
 x &= 10e^{-\pi t} + 10\pi te^{-\pi t}
 \end{aligned}$$

2.6

$$\begin{aligned}
 \frac{\omega}{\omega_0} &= \frac{\omega_0 \sqrt{1 - 1/4Q^2}}{\omega_0} \\
 &= \sqrt{1 - 1/4Q^2} \\
 &= 1 - \frac{1/4Q^2}{2} + \dots \\
 &\approx 1 - \frac{Q^2}{8}
 \end{aligned}$$

2.7

The amplitude of each pendulum decreases over time by a factor of

$$\begin{aligned}
 \exp\left(-\frac{\gamma t}{2}\right) &= \exp\left(-\frac{bt}{2m}\right) \\
 &= \exp\left(-\frac{bt}{2 \cdot \frac{4}{3}\pi r^3 \rho}\right) \\
 &= \exp\left(-\frac{3bt}{8\pi r^3 \rho}\right) \\
 &= \exp\left(-\frac{3bt}{8\pi r^3}\right)^{1/\rho}.
 \end{aligned}$$

After 10 minutes the amplitude of oscillation of the aluminium pendulum has decreased to half of its initial value

$$\begin{aligned}
 \exp\left(-\frac{225b}{\pi r^3}\right)^{1/\rho_a} &= \frac{1}{2} \\
 \exp\left(-\frac{225b}{\pi r^3}\right) &= \left(\frac{1}{2}\right)^{\rho_a}
 \end{aligned}$$

so the brass pendulum's amplitude of oscillation has decreased by a factor of

$$\begin{aligned}
 \exp\left(-\frac{225b}{\pi r^3}\right)^{1/\rho_b} &= \left(\frac{1}{2}\right)^{\rho_a/\rho_b} \\
 &= 0.802
 \end{aligned}$$

2.8

(a)

$$\begin{aligned}
 x &= A \sin \omega t \\
 v &= \omega A \cos \omega t \\
 a &= -\omega^2 A \sin \omega t \\
 E &= \int_0^T \frac{K e^2 a^2}{c^3} dt \\
 &= \int_0^T \frac{K e^2 \omega^4 A^2 \sin^2 \omega t}{c^3} dt \\
 &= \frac{K e^2 \omega^4 A^2}{c^3} \int_0^{2\pi/\omega} \sin^2 \omega t dt \\
 &= \frac{K e^2 \omega^4 A^2}{c^3} \left[\frac{t}{2} - \frac{1}{4\omega} \sin 2\omega t \right]_0^{2\pi/\omega} \\
 &= \frac{K e^2 \omega^3 A^2 \pi}{c^3}
 \end{aligned}$$

(b)

$$\begin{aligned}
 Q &= \frac{\frac{1}{2} m \omega^2 A^2}{\frac{K e^2 \omega^3 A^2 \pi}{2\pi c^3}} \\
 &= \frac{c^3 m}{e^2 K \omega}
 \end{aligned}$$

(c)

$$\begin{aligned}
 \tau &= \frac{1}{\gamma} \\
 &= \frac{Q}{\omega} \\
 &= \frac{c^3 m}{e^2 K \omega^2} \\
 &= \frac{c^3 m}{e^2 K (2\pi(c/\lambda))^2} \\
 &= \frac{\lambda^2 c m}{4\pi^2 e^2 K} \\
 &\approx 1.13 \times 10^{-8} \text{ s}
 \end{aligned}$$

3 Forced Oscillations

3.1

$$\begin{aligned}
 A(2 \text{ rad/s}) &= 1.3 \times 10^{-2} \text{ m} \\
 \delta(2 \text{ rad/s}) &= 0.58^\circ \\
 A(20 \text{ rad/s}) &= 0.13 \text{ m} \\
 \delta(20 \text{ rad/s}) &= 90^\circ \\
 A(100 \text{ rad/s}) &= 5.2 \times 10^{-4} \text{ m} \\
 \delta(100 \text{ rad/s}) &= 179^\circ
 \end{aligned}$$

3.2

$$\begin{aligned}
 A(\omega) &= \frac{a\omega_0/\omega}{\sqrt{(\omega_0/\omega - \omega/\omega_0)^2 + 1/Q^2}} \\
 &= \frac{au}{\sqrt{(u - 1/u)^2 + 1/Q^2}} \\
 &= \frac{a}{\sqrt{(1 - 1/u^2)^2 + 1/u^2 Q^2}}
 \end{aligned}$$

$A(\omega)$ is maximised when the denominator is minimised which occurs when

$$\begin{aligned}
 \frac{d}{du}((1 - u^{-2})^2 + Q^{-2}u^{-2}) &= 0 \\
 2(1 - u^{-2})2u^{-3} - 2Q^{-2}u^{-3} &= 0 \\
 4(1 - u^{-2}) - 2Q^{-2} &= 0 \\
 \frac{4Q^2 - 2}{Q^2} &= \frac{4}{u^2} \\
 \frac{Q^2}{4Q^2 - 2} &= \frac{u^2}{4} \\
 \frac{4Q^2}{4Q^2 - 2} &= u^2 \\
 \frac{1}{1 - 1/2Q^2} &= u^2 \\
 \frac{1}{\sqrt{1 - 1/2Q^2}} &= \frac{\omega_0}{\omega_{\max}} \\
 \omega_{\max} &= \omega_0 \sqrt{1 - 1/2Q^2}
 \end{aligned}$$

at which point the amplitude will be

$$\begin{aligned}
A_{\max} &= \frac{a\omega_0/\omega_0\sqrt{1-1/2Q^2}}{\sqrt{\left(\frac{\omega_0}{\omega_0\sqrt{1-1/2Q^2}} - \frac{\omega_0\sqrt{1-1/2Q^2}}{\omega_0}\right)^2 + 1/Q^2}} \\
&= \frac{a/\sqrt{1-1/2Q^2}}{\sqrt{\left(\frac{1}{\sqrt{1-1/2Q^2}} - \sqrt{1-1/2Q^2}\right)^2 + 1/Q^2}} \\
&= \frac{a/\sqrt{1-1/2Q^2}}{\sqrt{\left(\frac{1-1+1/2Q^2}{\sqrt{1-1/2Q^2}}\right)^2 + 1/Q^2}} \\
&= \frac{a/\sqrt{1-1/2Q^2}}{\sqrt{\frac{1}{4Q^4(1-1/2Q^2)} + 1/Q^2}} \\
&= \frac{a/\sqrt{1-1/2Q^2}}{\sqrt{\frac{1+4Q^2(1-1/2Q^2)}{4Q^2(1-1/2Q^2)}}} \\
&= \frac{a}{\sqrt{1-1/2Q^2}} \sqrt{\frac{4Q^2(1-1/2Q^2)}{1+4Q^2(1-1/2Q^2)}} \\
&= a\sqrt{\frac{4Q^2}{1+4Q^2(1-1/2Q^2)}} \\
&= aQ\sqrt{\frac{4}{4(1-1/2Q^2)+1/Q^2}} \\
&= \frac{aQ}{\sqrt{1-1/2Q^2+1/4Q^2}} \\
&= \frac{aQ}{\sqrt{1-1/4Q^2}}
\end{aligned}$$

3.3

(a)

$$\begin{aligned}

&\approx 0.25 \%
\end{aligned}$$

(b)

$$\begin{aligned}
\frac{A_{\max} - A_0}{A_0} &= \frac{1}{\sqrt{1-1/4Q^2}} - 1 \\
&\approx 0.13 \%
\end{aligned}$$

3.4

$$\begin{aligned}

 &= \frac{\overline{P}_{\max}}{Q^2 [4(\Delta\omega/\omega_0)^2 + 1/Q^2]} \\
 &= \frac{50}{625 [4(\Delta\omega/100)^2 + 1/625]} \\
 &= \frac{50}{\frac{1}{4}\Delta\omega^2 + 1}
 \end{aligned}$$

3.5

(a)

$$\frac{\omega_0}{2\pi} = \frac{1}{2\pi\sqrt{LC}} \approx 398 \text{ Hz}$$

(b)

$$I = \frac{V_0}{R} = \frac{15}{75} = 0.2 \text{ A}$$

3.6

So the first normal mode is

$$x_2 = 3A \cos \sqrt{\frac{2k}{3m}} t$$

where the masses oscillate in phase and the lower mass has an amplitude 3 times greater than the upper mass.

(ii)

$$\begin{aligned}\left(n + \frac{1}{2}\right) \frac{\lambda L}{a} - \left(-n - \frac{1}{2}\right) \frac{\lambda L}{a} &= (2n + 1) \frac{\lambda L}{a} \\ &= 9.7 \text{ mm}\end{aligned}$$

The original 15th bright fringe occurs at a distance $d = 15 \frac{\lambda L}{a}$ from the middle of the slits. The light passing through the covered slit travels an additional optical distance of $(n - 1)t$ where n is the refractive index of the material and t is its thickness. The light passing through the other slit travels an additional distance of $a \sin \theta = a \frac{d}{L}$. The additional distances must be equal so

$$\begin{aligned}(n - 1)t &= a \frac{d}{L} \\ t &= \frac{ad}{L(n - 1)} \\ &= \frac{15\lambda}{n - 1} \\ &= 12.5 \mu\text{m}\end{aligned}$$

$$(a) \quad \theta \approx \frac{w}{l} = \frac{1.4 \times 10^6 \text{ km}}{1.5 \times 10^8 \text{ km}} = 9.33 \times 10^{-3} \text{ rad}$$

$$(b) \quad \theta \ll \frac{2\lambda}{a} = 1.47 \times 10^{-3} \text{ rad}$$

7.5

$$\begin{aligned}d &= 0.06 \text{ mm} \\ \theta &= 15 \frac{\lambda}{a} \\ \theta &= \frac{\lambda}{d} \\ 15 \frac{\lambda}{a} &= \frac{\lambda}{d} \\ a &= 15d \\ &= 0.9 \text{ mm}\end{aligned}$$

 n\pi &= ka \sin \theta/2 \\
 &= \frac{2\pi}{\lambda} a \sin \theta/2 \\
 \sin \theta &= \frac{n\lambda}{a}
 \end{aligned}$$

In the first quadrant $0 \leq \sin \theta \leq 1$ so $0 \leq \frac{n\lambda}{a} \leq 1$ which allows $n = 0, 1, 2, 3,$ and 4 meaning there are 16 maxima.

- (a) $\lambda = 2 \frac{1.0}{4001} = 500 \text{ nm}$
- (b) Let $\lambda_1 = 589.0 \text{ nm}$ and $\lambda_2 = 589.6 \text{ nm}$. The number of maximums observed in the first wavelength is equal to $2x/\lambda_1$ and the number of maximums observed in the second wavelength is $2x/\lambda_2$.

$$\begin{aligned}
 \frac{2x}{\lambda_1} &= \frac{2x}{\lambda_2} + 1 \\
 2x \left(\frac{1}{\lambda_1} - \frac{1}{\lambda_2} \right) &= 1 \\
 2x \frac{\lambda_2 - \lambda_1}{\lambda_1 \lambda_2} &= 1 \\
 x &= \frac{\lambda_1 \lambda_2}{2(\lambda_2 - \lambda_1)} \\

\frac{2l(n-1)}{\lambda} &= 90 \\
n-1 &= \frac{45\lambda}{l} \\
n &= 1 + \frac{45\lambda}{l} \\
