#### 2.41

By Gauss's law, the electric field of each plate is

$$\oint \mathbf{E} \cdot d\mathbf{a} = \frac{Q_{\text{enc}}}{\epsilon_0}$$
$$2A'E = \frac{A'\frac{Q}{A}}{\epsilon_0}$$
$$\mathbf{E} = \frac{Q}{2A\epsilon_0}\hat{\mathbf{n}}$$

so the field between the plates is zero and the field outside is  $Q/A\epsilon_0\hat{\mathbf{n}}$ , resulting in a pressure of

$$\begin{split} P &= \frac{\epsilon_0}{2} E^2 \\ &= \frac{\epsilon_0}{2} \frac{Q^2}{A^2 \epsilon_0^2} \\ &= \frac{Q^2}{2A^2 \epsilon_0} \end{split}$$

$$\begin{split} \mathbf{E}_{\mathrm{above}} &= \frac{1}{4\pi\epsilon_0} \frac{Q}{r^2} \hat{\mathbf{r}} \\ \mathbf{f} &= \frac{1}{2} \sigma \mathbf{E}_{\mathrm{above}} \\ &= \frac{1}{2} \frac{Q}{4\pi R^2} \frac{1}{4\pi\epsilon_0} \frac{Q}{R^2} \hat{\mathbf{r}} \\ &= \frac{Q^2}{32\pi^2 \epsilon_0 R^4} \hat{\mathbf{r}} \\ \mathbf{F} &= \int_0^{2\pi} \int_0^{\pi/2} \frac{Q^2}{32\pi^2 \epsilon_0 R^4} \cos \theta R^2 \sin \theta \, d\theta \, d\phi \hat{\mathbf{z}} \\ &= \frac{Q^2}{16\pi\epsilon_0 R^2} \int_0^{\pi/2} \cos \theta \sin \theta \, d\theta \hat{\mathbf{z}} \\ &= \frac{Q^2}{32\pi\epsilon_0 R^2} \hat{\mathbf{z}} \end{split}$$

$$\begin{split} \oint \mathbf{E} \cdot d\mathbf{a} &= \frac{Q}{\epsilon_0} \\ 2\pi s L E &= \frac{Q}{\epsilon_0} \\ \mathbf{E} &= \frac{Q}{2\pi L \epsilon_0} \frac{1}{s} \hat{\mathbf{s}} \\ V &= -\int_b^a \frac{Q}{2\pi \epsilon_0 L} \frac{1}{s} \, dr \\ &= \frac{Q}{2\pi \epsilon_0 L} \ln \frac{b}{a} \\ C &= \frac{Q}{V} \\ &= \frac{2\pi \epsilon_0 L}{\ln b/a} \end{split}$$

$$\begin{split} V_{\text{ave}} &= \frac{q}{4\pi\epsilon_0} \frac{1}{2zR} \sqrt{z^2 + R^2 - 2zR\cos\theta} \Big|_0^{\pi} \\ &= \frac{q}{4\pi\epsilon_0} \frac{1}{2zR} \left( \sqrt{z^2 + R^2 + 2zR} - \sqrt{z^2 + R^2 - 2zR} \right) \\ &= \frac{q}{4\pi\epsilon_0} \frac{1}{2zR} \left( \sqrt{(z+R)^2} - \sqrt{(R-z)^2} \right) \\ &= \frac{q}{4\pi\epsilon_0} \frac{1}{2zR} (z+R-R+z) \\ &= \frac{1}{4\pi\epsilon_0} \frac{q}{R} \end{split}$$

The average potential due to external charges is  $V_{\rm center}$  and the average potential due to internal charges is

$$\frac{1}{4\pi\epsilon_0} \frac{Q_{\rm enc}}{R}$$

SO

$$V_{\rm ave} = V_{\rm center} + \frac{1}{4\pi\epsilon_0} \frac{Q_{\rm enc}}{R}$$

A stable equilibrium is a minimum of potential energy. Laplace's equation doesn't allow for minimums, so they must be saddle points and the charge can escape.

$$0 = \nabla^{2}V$$

$$= \frac{1}{r^{2}} \frac{\partial}{\partial r} \left( r^{2} \frac{\partial V}{\partial r} \right)$$

$$= \frac{1}{r^{2}} \left( 2r \frac{\partial V}{\partial r} + r^{2} \frac{\partial^{2}V}{\partial r^{2}} \right)$$

$$= \frac{2}{r} \frac{\partial V}{\partial r} + \frac{\partial^{2}V}{\partial r^{2}}$$

$$V = \frac{c_{1}}{r} + c_{2}$$

$$0 = \nabla^{2}V$$

$$= \frac{1}{s} \frac{\partial}{\partial s} \left( s \frac{\partial V}{\partial s} \right)$$

$$= \frac{1}{s} \frac{\partial V}{\partial s} + \frac{\partial^{2}V}{\partial s^{2}}$$

$$V = c_{1} + c_{2} \ln s$$

$$= -\frac{q^2}{4\pi\epsilon_0} \left( \frac{R}{a} \right)^3 \frac{2a^2 - R^2}{(a^2 - R^2)^2}$$

(a) 
$$V(x,y,z) = \frac{1}{4\pi\epsilon_0} \lambda \ln \frac{y^2 + (z+d)^2}{y^2 + (z-d)^2}$$

(b) 
$$\sigma = -\epsilon_0 \left. \frac{\partial V}{\partial z} \right|_{z=0}$$

#### 3.11

You need three charges: -q at (-a,b), -q at (a,-b), and q at (-b,-a). The potential is

$$V = \frac{1}{4\pi\epsilon_0} q \left( \frac{1}{\sqrt{(x-a)^2 + (y-b)^2}} - \frac{1}{\sqrt{(x+a)^2 + (y-b)^2}} - \frac{1}{\sqrt{(x-a)^2 + (y+b)^2}} + \frac{1}{\sqrt{(x+a)^2 + (y+b)^2}} \right).$$

The force on q is

$$\mathbf{F} = \frac{q^2}{16\pi\epsilon_0} \left[ \left( \frac{a}{(a^2 + b^2)^{3/2}} - \frac{1}{a^2} \right) \,\hat{\mathbf{x}} + \left( \frac{b}{(a^2 + b^2)^{3/2}} - \frac{1}{b^2} \right) \,\hat{\mathbf{y}} \right].$$

The work to bring q in from infinity is

$$W = \frac{q^2}{16\pi\epsilon_0} \left( \frac{1}{\sqrt{a^2 + b^2}} - \frac{1}{a} - \frac{1}{b} \right).$$

#### 3.12

Two infinitely long wires running parallel to the x-axis a distance 2a apart with charge densities  $\lambda$  and  $-\lambda$  have cylindrical equipotential surfaces with centres at

$$y_0 = \pm a \coth \frac{2\pi\epsilon_0 V_0}{\lambda}$$

radii

$$R = a \operatorname{csch} \frac{2\pi\epsilon_0 V_0}{\lambda}.$$

We know the equipotential surfaces (the pipes) and want to find the wires so we can find the potential, so

$$d = a \coth \frac{2\pi\epsilon_0 V_0}{\lambda}$$

$$R = a \operatorname{csch} \frac{2\pi\epsilon_0 V_0}{\lambda}$$

$$\frac{d}{R} = \cosh \frac{2\pi\epsilon_0 V_0}{\lambda}$$

$$\operatorname{arcosh} \frac{d}{R} = \frac{2\pi\epsilon_0 V_0}{\lambda}$$

$$\lambda = \frac{2\pi\epsilon_0 V_0}{\operatorname{arcosh} d/R}$$

$$R = a \operatorname{csch} \operatorname{arcosh} \frac{d}{R}$$

$$a = \frac{R}{\operatorname{csch} \operatorname{arcosh} d/R}$$

$$= (d+R)\sqrt{\frac{2d}{d+R} - 1}$$

$$= \sqrt{d^2 - R^2}$$

thus the potential is

$$V = \frac{V_0}{2\operatorname{arcosh} d/R} \ln \frac{(y+d^2-R^2)^2 + z^2}{(y-d^2+R^2)^2 + z^2}.$$

$$V_{0}(y) = \begin{cases} V_{0} & 0 \le y \le \frac{a}{2} \\ -V_{0} & \frac{a}{2} \le y \le a \end{cases}$$

$$C_{n} = \frac{2}{a} \left( \int_{0}^{a/2} V_{0} \sin \frac{n\pi y}{a} \, dy - \int_{a/2}^{a} V_{0} \sin \frac{n\pi y}{a} \, dy \right)$$

$$= \frac{2V_{0}}{n\pi} \begin{cases} 0 & n \text{ is odd or divisible by 4} \\ 4 & \text{otherwise} \end{cases}$$

$$\sigma = -\epsilon_0 \frac{\partial V}{\partial x}$$

$$= \frac{4\epsilon_0 V_0 \sin \frac{\pi y}{a}}{a \left(1 - \cos \frac{2\pi y}{a}\right)}$$

This is opposite to the torque experienced by  $\mathbf{p}_1$ .

#### 4.30

The electric field is perpendicular to each plate and "curves" towards the other. At y=0 the electric field is purely vertical.  $\mathbf{p}$  only has a y component so  $(\mathbf{p} \cdot \nabla)\mathbf{E} = p_y \nabla E_y$ . The potential difference between the two plates is constant and as x increases the distance between them also increases, meaning the magnitude of the electric field decreases.  $E_y$  is negative at y=0 so this means it increases with increasing x and thus that the x component of  $\nabla E_y$  is positive.  $E_y$  is constant for small changes in y around y=0 so the y component of  $\nabla E_y$  is 0. We assume the plates are very long in the z direction so the z component of  $\nabla E_y$  is also 0. This means the dipole experiences a force in the x direction.
